

Van Diemen RF00 fuel stick

Made from 5/16" poplar dowel.

Lines are lightly cut into the dowel with a mini-hacksaw, and emphasized with a Sharpie.

Only use the stick if there is a gap in the foam for it. Be careful not to disturb or damage the foam in cell – it will only end up in a fuel filter or blocking up something in the carbs or injection system. Markings are for US gallons.
